

## Data Collection and Preprocessing Phase

|               |                                                                                       |
|---------------|---------------------------------------------------------------------------------------|
| Date          | 25 December 2025                                                                      |
| Project Title | Predicting Plant Growth Stages with Environmental and Management Data Using Power BI. |
| Maximum Marks | 3 Marks                                                                               |

### Data Quality Report:

| S. No. | Data Source       | Column Name      | Data Quality Issue   | Severity | Resolution Plan                                                                                 |
|--------|-------------------|------------------|----------------------|----------|-------------------------------------------------------------------------------------------------|
| 1.     | plant_growth_data | All Columns      | Missing Values Check | High     | No missing values were found.                                                                   |
| 2.     | plant_growth_data | All Rows         | Duplicate Records    | Medium   | No duplicate rows were detected.                                                                |
| 3.     | plant_growth_data | Temperature      | Outlier Validation   | Low      | These temperatures are normal for plant growth. No data removal required.                       |
| 4.     | plant_growth_data | Growth_Milestone | Class Imbalance      | High     | The distribution is balanced(49.7%Success vs.50.3%Failure). No re-sampling techniques required. |
| 5.     | plant_growth_data | Soil_Type        | Consistency Check    | Low      | Standardized values found: loam, sandy, clay. No inconsistencies found.                         |

## SUMMARY:

The raw data source plant\_growth\_data.csv was subjected to a rigorous quality assessment. The dataset consists of 193 records and 7 attributes with zero missing values and zero duplicate records.

### Key Qualities:

- **Completeness:** The data is 100% complete, requiring no imputation strategies.
- **Validity:** Numerical ranges for Temperature (15-35°C) and Humidity (30-80%) are biologically valid and require no outlier removal.
- **Reliability:** The target variable (Growth\_Milestone) is perfectly balanced (~50/50 split), which is ideal for the proposed Power BI predictive analysis.
- **Conclusion:** The data is deemed **High Quality** and is approved for immediate use in the Data Modeling phase without further remediation.
